

ALPINE ACCUMULATOR & PERSONAL WALKWAY: This conveyor provides several advantages to the customer in a single integrated unit. It presents empty pallets to a machine for part placement; then conveys and accumulates the pallets to the opposite side of the system for part removal. Empty pallets are then accumulated and returned. Each of the tandem double serpentine accumulators provide over 100' of pallet storage. The bi-flow crossover conveyors allow the full and empty pallets to circulate between the alpiners while providing a "doorway" for people and equipment. This type of conveyor assembly provides tremendous floor space utilization and maximizes machine uptime by use of the large pallet buffers.
