

**CONVEYOR VERSATILITY**— The versatility of the FlexLink modular conveyor system is demonstrated here in several ways. The product is stamped steel “can or shell” which is handled on a standard model XL conveyor. The can is then transferred to a vertical wedge conveyor-elevator. It enters the lower section in a horizontal position, elevates vertically, then discharges at a higher point in the horizontal position. A FlexLink conveyor with custom magnetic chain then transports the product vertically, around a tight radius bend, upside down and returns it to a horizontal position. The cans are then transferred to a first in, first out (FIFO) accumulator section of conveyors with a common drive and custom machined guide rails to conserve space.
